Project Development Phase
Performance Test

Date	31 October 2026
Team ID	Individual Project (No Team ID)
Project Name	Global Fuel Prices and Taxation Trends: A Comprehensive Global Performance Intelligence Report
Maximum Marks	

Project Performance Testing:

Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Screenshot / Values
1.	Data Rendered	Dataset supplied as CSV: approximately 27,468 records covering 84 countries and 7 regions (January 2020–April 2026). The workbook connects directly to the CSV; no database was used. This is the source dataset size, not a measured database-rendering benchmark.
2.	Data Preprocessing	The CSV was connected directly in Tableau Public and used to build charts and dashboards. No separate ETL tool, SQL cleaning pipeline, or detailed transformation log is documented, so additional preprocessing steps are not claimed.
3.	Utilization of Filters	Visible filters in Scenario 3 include Income Level, Region, and Subsidy Level. Scenario 1 displays a Region legend; Scenario 2 displays Region and Measure Names legends. Legends are not filters unless configured as such. Filter response time was not measured.
4.	Calculation fields Used	No custom calculated fields can be confirmed from the available project evidence. The visualisations use Tableau aggregations such as averages and country rankings. Standard aggregations do not establish that custom calculated fields were created.
5.	Dashboard design	3 dashboards; 4 visualisations per dashboard; 12 dashboard visualisations in total. Desktop layout is arranged as a two-by-two chart grid, with legends and filters where visible. Mobile responsiveness and timed rendering performance were not tested.
6	Story Design	A separate Tableau Story has not been established as

		implemented. Story scenes/visualisation count: Not applicable to the current workbook evidence. If Skill Wallet requires a Story as a mandatory deliverable, create it before marking this item complete.

PERFORMANCE CHECK SUMMARY AND EVIDENCE

Scope: This document records checks supported by the existing Tableau workbook, the supplied dataset details, and the latest screenshots. It is not a formal load test or a measured performance benchmark.

Check	Status	Evidence / limitation
Workbook/dashboard availability	Observed	The published Tableau Public workbook link was provided and screenshots of all three dashboards are available.
Dashboard visual structure	Observed	Each dashboard screenshot shows four visualisations arranged in a grid.
Filter controls	Observed in Scenario 3	Income Level, Region, and Subsidy Level controls are visible in the latest screenshot.
Dataset scale	Dataset metadata	Approximately 27,468 records, 84 countries, and 7 regions; not a measured rendering benchmark.
Load time / latency	Not measured	No stopwatch, browser performance trace, or benchmark result was supplied.
Concurrent-user capacity	Not tested	No load or concurrency test was performed.
Mobile responsiveness	Not tested	Available screenshots show a desktop view.
Tableau Story performance	Not applicable / not confirmed	A separate Story has not been established as implemented.

WEBSITE FUNCTIONAL TESTING

The Flask-based project website was tested to verify its basic functionality and integration with the Tableau Public dashboard.

Test Case	Testing Procedure	Result
Website Availability	Opened the live website hosted on Render and checked whether it loaded without errors.	Pass
Page Content	Verified that the website title and project overview were displayed correctly.	Pass
Tableau Dashboard Integration	Checked whether the embedded Tableau Public dashboard loaded on the website.	Pass
Dashboard Interaction	Tested interaction with the embedded dashboard, including dashboard navigation or available filters.	Pass

Testing Summary: All four basic functional checks passed. The website loaded successfully, displayed the project information, integrated the Tableau Public dashboard, and supported dashboard interaction.
Testing Limitation: These checks confirm basic functionality only. They do not establish measured page-load speed, response latency, concurrent-user capacity, or mobile responsiveness.

Conclusion

The project has three scenario dashboards with four visualisations each and visible filtering controls in Scenario 3. The evidence supports documenting dashboard structure and visible interactions, but not numerical claims about rendering speed, query latency, concurrency, or mobile performance. These should be measured separately if formal performance testing is required.
